

Most important thing we discussed

Student B – CTLs are happening long time ago

Student C – Recommendations are quite good

Student A – not really

Student D – nothing really surprised me

Flipped learning on units – useful for all units? [think they didn't get the question]

Student B – we have too little lab, haven't done lab at all, felt that pharmacy would have a lot more practical

Student A – might

Student B – flipped learning

Student A – maybe the workshops could be more

Student C – CC can have more IL (cause not enough initial explanation), for PP maybe can have less workshop, lectures, some workshops are useless

PLP

Student A – concern on PLP, assessment not fair, cause lecturer decides what is good or not good, its not fair, fairness of interpretation.

Student B – In terms of marks its good cause can refer, but in terms of disturbance it's a disadvantage. Doesn't measure knowledge well but measures how effective at finding resources. Not much time to refer to things during the open books exams.

Student C – good that can refer for quizzes, but time limit makes it hard to refer. Also harder to do group study during the online thing. Most

Student D – same points as Student A and Student B. Maybe some unfairness due to references.

Technological challenge

Student A – sometimes webcam issues, or mic issues, which can be an issue.

Student B – In case of hardware failure, no backup, can be risky.

Student C – hard to ask online on certain things, especially if there are many

Student D – can have issues with hardware redundancy. Attendance can be lower online cause can refer to recordings, maybe did not get full benefit of lectures. Sometimes hard to put questions acStudent Cs, an example of a rubric for a CC unit, the implementation can be an issue. Cause offline one could just fill and exchange, but online each must submit individual rubric and did know know as a patient or pharmacist.

Pre-class materials

Student A – Like cause can do beforehand. Don't like cause can be incomplete, or confusing, and teacher may not teach it clearly. Very much concerned with the confusion of discovery and the fact that its not clarified even after the next year

Student B – Also concerned with the confusion, gave examples of fiber on IBS, it looked like its bad

Student C – Likes the general format of discovery, IL, workshop, CTL. Feels that discovery has too many links. Sometimes notes can be too confusing, for example diabetes, in clinical practice guidelines its organized, but in discovery its confusing.

Student D – Discovery can be good, but to improve cause too many links, sometimes not sure what to read, should try to clarify what needs to be read, and what is extra. Also discovery can be misleading, and sometimes its downloaded beforehand and then did not correct. Sometimes video content has issues with accent, or understanding the content. Best to have both notes and transcript.

In class activities

Student A -

Student B – Access to different workshop scenarios can be an issue, if can't see other questions.

Student C – Sometimes workshops don't give the answers. Prefers having scenario and answer for both sessions. Feel can put all the workshop materials in moodle link. Can consider giving feedback on the student answers if don't want to give answers directly.

- b. Student B: unstable internet
 - c. Student B + Student A : could struggle during assessment
 - d. Student B: feel frustrated
 - e. Student A: would probably panic and freak out but haven't had it during assessments yet
- 7. Use of new softwares – moodle, zoom
 - a. Student A: No problem so far
 - b. Student B: initial struggle
- 8. Student A: prefer sem 2 IL vs Sem 1 – likes to ask question immediately and getting a response
Student B: No preference for Sem 2 or Sem 1 lecture (recorded or live)
Student A: Workshop online
-enjoys Prof practice
Student A: struggle with presentation and public speaking skills
Student A: Workshops – people don't switch on camera and struggle to discuss and talk.
Student B + Student A: prefer talking vs typing
Student A: good idea to switch on camera and audio

CTL

Student B: ok with it

Student A: same

PART 2: flipped learning

1. Discovery materials
Student A: likes to print discovery materials and read it – prefers words than clips
Student B: opposite

Student A: more IL's + explain discovery materials better
Student A: past year papers
Student B: having discovery beforehand is good and likes the ability to study a bit first
Student A: did not have much oral exam in UEC
Student A+ Student B: does enjoy asking questions and interaction, being invited to ask question
2. Student A: learn more about Malaysia context
Student B
3. Student A: Monash Pharm more organized than other uni so far
Use whatsapp group chat?

Student B: email

Student A: harder to ask f2f question in lecture but ok in workshop

Other skills to develop

Student B: team working skills (compared wo working with old schools friends and new strangers)

Improvements:

Student A: More feedback

Student B: PASS sessions (real life vs zoom) – capacity

Student A + Student B: general ok with flipped learning

Student A + Student B: making friends has been biggest challenge so far in 2020, forcing Web cams switched on.

Student A + Student B: some interaction with seniors but did not ask for help .
